*1 The MK-760 can be connected arbitrarily to the MB-508 and MB-509.

*2 The HT-503 (or HT-515) and MK-746 can be connected arbitrarily to the LU-202m and LU-202XLm.

*3 The HT-504 can be connected arbitrarily to the PF-602m.

*4 The HT-506 can be connected arbitrarily to the PF-707m.

*5 When several paper feeders are configured, the connection of the FA-502 is required to the PF-707m except for the uppermost-stream one.

*6 The MK-761 can be connected arbitrarily to the FS-532, OT-511 and OT-512.

Note:

The IC-607 or IC-419 is used as the connection controller.

Installation of the MK-732 is required when you connect the PI-502 to the FS-532. Not supported for the 3rdParty options on the paper feed side.

When printing on carbonless paper (exclusive approved stock from the table above), it has to be taken into account that this media contains chemical components, and – if printing is mainly or exclusively on this media – increased contamination and wear of parts have to be expected. An increased abrasion of the substrate used is due to the chemical substances and will mainly affect the paper path components and in particular the registration unit. As a consequence, in addition to any adjustments required for proper media transport, all parts of the paper transport are subject to higher contamination and need to be cleaned more often. In addition to that, due to the chemical residue, the registration roller is likely to expand and change in diameter so that it might need to be replaced after approximately 500.000 prints, or whenever a misalignment in front-to-back registration becomes obvious.

Based on these findings, we recommend a detailed analysis of the customer's processes or planned applications. Frequent switching between carbonless paper jobs and high-registration print jobs may lead to increased service activities, requiring full maintenance and possible adjustments prior to any quality printing. We recommend a permanent and exclusive use of the printing system for carbonless paper jobs only.
